Quick start

Get started with CStrip2 Visual in minutes.

A channel strip with four audio stages and helpful visual displays. You do not need to use every module: start with what your track actually needs.

CStrip2 Visual in use: analyzer, Tone Curve, and processing controls in one window.

FOUR STAGES, IN THIS ORDER

01
CAPACITOR
Roll off unwanted deep bass or very high frequencies.

02
BUTTERCOMP
Control level changes and peaks.

03
EQ
Adjust lows, mids, and highs.

04
OUTPUT
Set the final level and add output-stage saturation.

WHERE TO START

Choose a familiar track. Loop a short passage, listen before adjusting anything, and start with small changes. Always compare at similar loudness.

Your first adjustments

A simple walkthrough of the essential controls.

01

Clean up the extremes

In **Capacitor**, try **HI-PASS** to remove sub-bass or **LO-PASS** to soften highs. Filter only as much as needed.

02

Hear the compression

Raise **COMPRES** until you hear more control and see movement on **GR**. Try **SPEED** to change the response. Not every track needs compression.

03

Shape the tone

Adjust **Bass**, **Mid**, or **Treble**. **Bass Frq** and **Treb Frq** move the regions these bands affect once you have boosted or cut a band.

04

Explore the output

Output defaults to **0.33**, the clean reference. Turn it up to add **output-stage saturation**, first **Spiral**, then **Density**. Compare at similar loudness to judge the character.

05

Save and compare

Use **SAVE** to store presets and **A/B** to compare two settings. The copy buttons transfer settings between the two states.

READING THE ANALYZER

IN (orange) and **OUT** (blue) let you compare signals; **SOURCE: BOTH** shows both. **GR** measures ButterComp gain reduction.

Tone Curve shows **Capacitor + EQ**, not compression. **Left:** signal level in dB. **Right:** EQ boost/cut in dB. **Bottom:** frequency in Hz.

REMEMBER

Listen in the mix, not only in solo. If you get lost, return to the starting settings and change one thing at a time.

Windows: VST3 / CLAP · **macOS: VST3 / CLAP / AUv2**
